

Waterboy says, Protect Your Drinking Water

Clean Water Starts With You!

What's the Problem?

Less than 1 percent of the water on Earth is available for drinking water.

When groundwater, rivers, lakes or streams get polluted with trash, oil, pesticides or other pollutants, drinking water sources get contaminated.

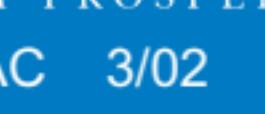

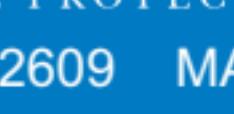

What Can You Do?

- Know where your drinking water comes from so you can keep pollution away from its source.
- Never put pollutants on the ground where they can seep into groundwater or be washed by rain into a river, lake or stream.
